04.Juli 2002**Method and Device for linking Multimedia Data**

The present invention relates to a method and device for
5 linking first and second multimedia data. Particularly,
these first and second multimedia data include a video
stream and photo pictures.

Background

10 Many digital camcorders can record video films on a tape and
photo pictures (or E-video clips) on a media-card. The image
contents taken in videos and photos are usually very corre-
lated and coherent. For example, video and photos might be
15 related in the following aspects: taken in the same time;
taken at the same place; shot to same objects (persons);
shot in a similar scene; taken during the same event; taken
under the same mood or feeling; photo and video are content-
compensated; photos represent the highlight still contents
20 of a video etc. Many kinds of new camcorders can even record
e-video clips on a media card. Such e-video clips represent
the highlight of a video. E-video clip is very a kind of
video thumbnail.

25 However, the video films on the tape and the photos (or E-
video clips) on the media-card are treated separately by ed-
iting and archiving. Such a procedure is illustrated in Fig.
1. A digital camcorder 100 is used for recording 101 a video
sequence on a camcorder mini-tape 102. At a later time the
30 video film is played back and edited 103 using a video re-
corder and a television set 104 or a personal computer 105.
Alternatively, the camcorder 100 may record 106 a photo on a
camcorder media-card 107. After recording the photo may be
viewed and edited 108 by using a personal computer 105.

While recording, no connection (or relation) is defined for the recording contents between video and photo (or e-video clip). Today, editing and customizing the relation between recordings on the tape and the media card requires an editing process separate from the act of recording itself, and this process is also performed on an equipment different from the recording equipment. However, it is impossible for a camera-man while recording to make use of still pictures (or e-video clips) in a media-card in order to set up more attractive features for the video contents on a tape.

Invention

In view of that it is the object of the present invention to provide a method and an apparatus which allows linking of two or more different multimedia data.

This object is solved by a method for linking multimedia data including the steps of providing first and second multimedia data, forming linking information on the basis of said first and/or second multimedia data, and storing said linking information on a first recording medium together with said first multimedia data.

Furthermore, according to the present invention there is provided a device for recording multimedia data including providing means for providing first and second multimedia data, linking means connected to said providing means for forming linking information on the basis of said first and/or second multimedia data, and storing means connected to said linking means for storing said linking information on a first recording medium together with said first multimedia data.

Preferably, the first and second multimedia data include video, photo and/or audio data. Thus, it is possible to mu-

tually link a video film or video sequences with photo pictures.

The linking information may include logo or index messages
5 for the video film, the photo pictures and/or any audio se-
quences. Such logo message contains linking information from
a video on the tape to a picture on the media card. The in-
dex message contains one or more codes of related pictures
10 on the current media card. With such logo or index messages
it is possible to link photo data and video data for example
on the basis of a photo picture included in these photo data
or by a video section included in this video data. One can
easily imagine that a characterizing photo picture facili-
tates the linkage of a plurality of pictures and video films
15 for the user.

Advantageously, the linking information may be formed in
real-time while recording the video on the video tape. Thus,
both is possible, the offline editing of logo and index pic-
20 tures as well as the real time generation of them.

Logo and index messages may be set up and recorded both on a
video tape and on a picture media-card. This technique has
the advantages of making an easy and fast recording opera-
25 tion possible, of helping the user to do post-editing and of
preventing the user from accidentally deleting any useful pic-
tures on the multimedia-card.

The pictures may be designed as "logo and index", "logo
30 only" and "index only". Furthermore, some strategies for re-
cording and playback may be designed as "visible" and "in-
visible", "copy now" and "copy later", "playback with logo"
and "playback without logo". Additionally, an e-video-clip
may be used as logo or index message. Thus, the present in-
35 vention helps to set up a significant "bridge" between video
essence and photo essence separately recorded by a digital
camcorder.

The logo and index pictures (metadata) are usually not generated directly from video frames. They are usually generated by photo shooting before the recording of video contents.

In other words, the Easy Video Logo & Index Picture Generation System according to the present invention for a Camcorder makes it possible to let the camera-man to set up logo or index pictures (or video clip) for video while recording. While a logo or index picture is being created, a logo-mark code is written to a special track on video tape, or a index-mark code is written to a special index file in the media-card. The logo pictures (or video clips) can improve a kind of "picture in picture" function. The logo picture provides additional messages to the recording video, and therefore it makes the recording more attractive. The index picture acts as a kind of rich media metadata for the video essence. It can be utilized to search video essence.

20

Drawings

Exemplary embodiments of the invention are illustrated in the drawings and are explained in more detail in the following description. In the drawings:

25

Fig. 1 shows the procedure of taking videos and photos by a digital camcorder of the prior art;

30

Fig. 2 shows the principle of taking videos and photos by a digital camcorder according to the present invention;

Fig. 3 shows the physical order of a video tape containing a logo track;

35

Fig. 4 shows a first part of the logical structure of a media card;

5 Fig. 5. shows a second part of the logical structure of a media card;

Fig. 6 shows a diagram of the system requirements;

10 Fig. 7 shows a diagram of the recording procedures of logo and index pictures;

Fig. 8 shows a diagram of the logo fixing during video play-back;

15 Fig. 9 shows a first continuation of figure 8;

Fig. 10 shows a second continuation of figure 8;

Fig. 11 shows a diagram for the procedure of index fixing.

20

Exemplary embodiments

The principle of taking videos and photos by a digital camcorder according to the present invention is shown in Fig.

25 2. Similar to the prior art, a camcorder 200 records 201 a video on a mini-tape 202. The recorded video may be played back and edited 203 by using a video recorder and a television set 204 or a personal computer 205. Additionally, the camcorder 200 may record 206 photos on a media card 207. The 30 recorded photos may be viewed and edited 208 by using the personal computer 205. Now, the following steps are provided by the present invention. A relation may be created 209 between the video and photo data. Information concerning the relation to the photos is written 210 as logo-info (see also 35 step 302 of Fig. 6) to the tape 202. Similarly information concerning the relation to the video recorded on the tape is

written 211 as index-info (see also step 405 of Fig. 6) to the media-card 207. Consequently, the video may be searched, played and edited 212 on the personal computer 205 by using the logo-info. Additionally, a photo may be searched, played 5 and edited 212 on the personal computer 205 by using the index-info.

The preferred system and its implementation components are described in the following, wherein the description for 10 "logo /index picture" is also valid for "logo /index e-video clip".

1. System Requirements 500 (see Fig. 6)

15 a) It is necessary to equip a camcorder with a set of buttons 501, which allow to put the camcorder in a special "mark input mode". In the basic embodiment, a camcorder has an annotation button in a central and easy to reach position. In an enhanced type of camcorder there may be provided 20 an E-video clip playback function. In order to create a logo / index picture for video, special memory space on a video tape and on a media-card must be reserved.

25 b) For the video tape 300 (compare also Fig. 3), a special logo track 302 (or logo bytes) for each video frame must be reserved on the tape for recording the logo-mark code 303. The logo-mark code 303 contains link messages from the video on the tape to a picture on the media-card. The logo-mark code 303 contains a media-card ID 304 and a picture ID message 305. The media-card ID message 304 is a kind of volume 30 message, it may be a predefined media-card name or number. The picture ID includes the picture name message.

Fig. 3 indicates the physical structure of a video tape 300. 35 The video tape 300 contains a plurality of video frames 301 each formed by a number of data bits. Within the video frame

301 there is provided a logo track 302 for the logo-info,
i.e. the logo marke code 303, containing a media-card ID 304
and a picture ID 305. Thus, there is a link to a logo pic-
ture on a specific media card.

5

c) For media-card 400 (compare also Fig. 4 and 5), the index
info 405 including a special index file 420, a special tem-
porary file 410 and a special thumbnail directory 430 must
be generated in' the media-card. The index file 420 in the
10 media-card 400 is created for a recording index-mark code
421. The temporary file 410 is used to keep temporary index
code 411 for logo/ index picture candidates. The thumbnail
directory 430 is set to store all thumbnail pictures 431,
which may be used as logo or index pictures (see Fig. 4 and
15 6).

d) The index file 420 in the media-card 400 contains index-
mark codes 421 of all related pictures in the current media-
card as shown in Fig. 6. Whenever a picture is set as logo
or index to the video, an index-mark code 421 will be cre-
20 ated in the index file 420. The index-mark code 421 includes
all link messages between pictures on the media-card 400 and
video essence on the tape 300. There are two kinds of index-
mark codes 421:

25 When a picture is set as index picture 422 for video, the
index-mark code 421 includes a picture ID 424 and video es-
sence ID message 423. The picture ID 424 contains a picture
name 427, directory name 428 and status label 429 of the re-
lated picture. The statüs label shows if the picture is
30 "logo & index", "logo only" or "index only". More about
status label will be explained in detail in 2(h) and 3(c to
e). The video essence ID 423 contains video tape ID 425,
video content start-time and end-time message 426. The video
tape ID 425 may be a predefined tape name or number.

35 When a picture is only set as logo picture 412 for video,
the index-mark code 421 contains only the picture ID 424. In

this case, no video essence ID 423 is needed. See also Fig. 5.

- e) The temporary file 410 shown in Fig. 5 contains index codes of all candidate pictures in the current media-card 400. When a picture is selected as candidate to create video logo or index, an index code (compare 411 of Fig. 6) will be written in the temporary file 410. The index code includes a picture ID message 424, the picture ID contains picture name 427, directory name 428 and status label 429 of the selected picture. While video recording, camera-man may select pre-defined logo or index candidate directly from the candidate file.
- f) The thumbnail directory 430 shown in Fig. 4 contains all thumbnail pictures, which are used as logo / index pictures for video. Compared to an original picture, a thumbnail picture is reduced in size so that it needs less storage capacity. The thumbnail directory 430 has the advantage of protecting thumbnail pictures so that they are not affected by normal photo editing.
- g) A special synchronizing playback method is needed to build e-video clip logo in video frames as indicated by reference signs 502 in Fig. 6. In this case, an e-video clip can be treated as a series of still pictures. Each picture may be built in video frame one by one.

2. Preparation for Recording

- a) In order to create logo & index pictures for a video while recording, a selected picture, which will be used as logo or index picture, should be recorded before the video is recorded. The picture may be taken by camcorder itself, or imported from other instruments. The picture may be saved as normal camcorder photo format, or as special thumbnail

format. The thumbnail format is defined specially for this application. A thumbnail picture will be saved directly in the thumbnail directory 430 of media-card 400 (see Fig. 4). Both photo formatted picture and thumbnail picture can be
5 selected as logo / index picture.

In the case of Fig. 4 pictures 1, 3 and 6 are stored as
10 thumbnail pictures with a reduced size in the thumbnail directory 430. Consequently, the pictures 1, 3 and 6 can be deleted from the picture directories 440 and 450. As a result memory capacity can be saved.

- b) The index screen of the camcorder may be used to select a preferred picture. The picture name 427, directory name 428 of the selected picture and a status label 429 (see 2(g)) is encoded as an index code 421, which is saved in the temporary file 410 in the media-card 400. A selected picture can be input into the temporary file 410 by clicking a button of
15 the camcorder. It is also possible to select the picture during video recording by inputting the picture index number directly.
- c) All selected pictures must be set to "protected" status,
20 so that they cannot be deleted erroneously.
- d) More than one picture can be selected as logo / index candidates picture to be stored in the temporary file. While video recording, all candidate pictures can be browsed
25 through button wheel turning.
- e) The logo picture format and position on the video can be defined before, during or after recording. The logo picture can be shrunk or enlarged inside the video frame. Furthermore,
30 the logo picture may be located at the upper, under, left or right corner. It may fill up the whole video frame.

- f) The logo picture may be processed according to a predefined effect function.
- g) The selected picture can be defined in three statuses:
5 "logo & index", "logo only" and "index only". A status label, which represents the status message, is created as part of the index code in the temporary file. The "logo & index" status means that the selected picture is defined both as logo and index picture for video. The "logo only" status
10 means that the selected picture is defined only as logo picture for video, it is impossible to use this picture as index metadata for video essence. The "index only" status means that the selected picture is defined only as index metadata for video essence, it is impossible to use it as
15 logo picture for video. The default status of a selected picture should be defined as "logo & index".
- h) The temporary file (see 1(e)) contains index codes of all logo / index candidate pictures. The index code includes
20 picture name, picture directory name and picture status label. The status label can represent "logo & Index", "logo only" and "index only". The temporary file should be created before video recording. The index codes in the candidate file will be cleared as soon as they are invalid.
25
- i) A selected picture can be used multiple as logo / index picture.
- 30 3. Recording 600 (see Fig. 7)
- a) While video recording, the camera-man only needs to click 601 a button to browse all selected pictures from the candidate file in the media-card. Through button clicking 601,
35 the camera-man can set a selected picture as logo or index picture for video. If no pre-selected picture exists in the candidate file, the camera-man only needs to click a button

to browse a list of all pictures of the media-card, and turn a wheel to select a picture and set the picture as logo or index picture for video. For a selected picture the statuses "logo-only" 602, "logo & index" 603 and "index only" 604 may
5 be chosen.

b) If a selected picture is set to be logo picture of video 605, the logo picture may be set to be visible 606 or invisible 607 in the camcorder view finder.

10 (1) When it is visible 606, its position and frame size may be adjusted by camera-man. The camera-man may choose whether to "copy now" 608 to the video tape or "copy later" 609. If "copy now" 608 is selected, the logo picture with its position and size in the view finder will be embedded in
15 the video contents and be permanently recorded on the video tape. Later the logo picture in the video can not be edited or deleted any more. In this case, it is not necessary to create any logo mark on the tape or index-mark in the media card 610. If "copy later" 609 is selected, the logo picture
20 is not recorded on the video tape, the picture stays still in the media card. It is still possible to edit the logo picture later at a post-processing stage. In this case, both logo-mark and index-mark are generated 611. The logo-mark code is written in the logo track on the tape, and the index-mark code, which contains only picture ID, is written in
25 the index file in the media-card. The selected picture must be set to "protected".

(2) When the logo picture is set to be invisible 607, the logo picture is not recorded on the video tape, and the logo picture will be edited at post-processing stage. In this case, both logo-mark and index-mark are generated 611. The logo-mark code is written in the logo track on the tape, and the index-mark code, which contains only the picture ID, is written in the index file in the media-card. The selected
35 picture must be set to "protected".

- c) If a selected picture is in "logo & index" status 603, it means that this picture will be set up as both logo and index picture for video. In this case, both logo-mark and index-mark are generated 611. The logo-mark code is written in 5 the logo track on the tape, and the index-mark code, which contains the picture ID and video essence ID, is written in the index file in the media-card. The logo-mark code and index-mark code are structured as described in paragraph 1.
- 10 When a selected picture is set as logo and index picture for video, it should be set to "protected".
In this scenario, the logo picture can be treated as described in 2(e).
- 15 d) If a selected picture is in "logo only" status 602, this picture will be created as logo picture for video.
In case, the logo picture is set as "visible" + "copy now" 606, 608, the logo picture is recorded on the tape, no logo-mark or index-mark code is generated in this scenario, 20 the related picture in media-card does not need to be set protected, and editing of this picture does not affect the already created log picture.
- In case, the logo picture is set "invisible" 607 or "visible" + "copy later" 606, 609, both logo-mark and index-mark must be generated. The logo mark code is written in 25 logo track (or logo bits) on the video tape. The index-mark code, which contains only the picture ID, is written in the index file of the media-card.
- 30 e) If a selected picture is in "index only" status 604, this picture will be created as index picture for video 612. Later, this picture acts as rich media metadata for video essence. In this case, only an index-mark is generated 613, 35 no logo-mark is necessary. The index-mark code, which contains both picture ID and video essence ID, is written in index file in media-card. The selected picture in the media-card must be set to "protected".

4. Logo Fixing 700 (see Fig. 8, 9 and 10)

a) At a post-processing stage, except the case of 3(b-1),
all in the recording stage generated logo pictures need to
5 be edited or fixed.

b) The logo-mark codes can connect video essences and logo
pictures. While video playing, the camcorder can automatically
read the logo-mark code from a logo track on a tape.

10 c) When the user plays or edits the video tape, he may
choose "playback with logo" 701 or "playback without logo"
702.

When "playback without logo" is chosen the camcorder will
15 play the video tape normally, logo-marks on video tape are
ignored 706.

When "playback with logo" 701 is chosen, the camcorder
reads all logo-marks. When the camcorder finds a new logo-
mark, it will pause the tape playback at the current video
20 frame, and ask the user whether to build the logo picture in
the video frame or not. If the user replies "not built-in",
the camcorder goes on playing the tape till next new logo-
mark. If the user replies "built-in", the camcorder will
parse the logo-mark code, tell the user to insert the cor-
25 rect media-card, read the index file of the media-card, find
out the directory of the logo picture, look for the logo
picture on the media-card and build the picture in the video
frame. The position and size of the logo picture viewed in
the video frame can be arranged and adjusted. The same logo
30 picture at the same position and with the same size will be
built in the following video frames, which contain the same
logo-mark code. When the camcorder reads a new logo-mark
code, it will repeat the above procedure.

35 d) When "playback with logo" 701 is chosen, the user may
have three choices to process the logo picture:

1) The user may record the logo picture permanently 703 in the video frame at the desired position with the desired size as shown in Fig. 9. Afterwards, the camcorder will check the index file and find out if this picture is still 5 locked by other index mark.

If the picture is not locked by another index mark 707 and it has "logo only" status 708 in the current index mark, the "protected" status of the picture will be cleared 709. Its index mark in index file will be cleared too. From now 10 on, the connection between this picture and video is cut. The picture is free.

If the picture is not locked by another index mark 707 and it has "logo & index" status 710 in the current index mark, the "protected" status of this picture will not be 15 cleared, but its status label in the current index mark will be modified as "index only" 711. From now on, this picture will act as pure index picture.

If the picture is locked by another index mark 712 and it has "logo only" status 713 in the current index mark, the 20 protected mark of the picture will not be cleared 714. But, the current index mark in index file will be cleared.

If the picture is locked by another index mark 712 and it has "logo & index" status 715 in current index mark, the 25 "protected" status of this picture will not be cleared, but its status label in the current index mark will be modified as "index only" 716. From now on, this picture will act as index picture for the current video clip.

2) The user does not want to record the logo picture in 30 the video frame at present 704. The user, however, may let the camcorder generate a thumbnail picture based on the logo picture 704, as shown in Fig. 10. The thumbnail picture will replace the original logo picture and act as logo picture for video 717. The thumbnail picture only needs less storage 35 space, and the original logo picture will be free from current connection. The thumbnail picture will be saved in the

thumbnail directory (see 1.(c) and (f)) in the media-card with the same file name as the original logo picture. Later, the thumbnail picture will be used as the only logo picture for video.

5 If the original logo picture is not locked by other index mark 719 and it has "logo only" status 720 in the current index mark, the "protected" status of the picture will be cleared 721, its directory name in current index mark will be modified to the name of the thumbnail directory. The
10 thumbnail directory name in current index mark will automatically lead the camcorder to read the thumbnail picture in thumbnail directory as the logo picture. The connection between original logo picture and video is cut. The original picture is free.

15 If the original logo picture is not locked by other index mark 719 and it has "logo & index" status 722 in current index mark, the "protected" status of the picture will be cleared 723. Its directory name in the current index mark will be modified to that of the thumbnail directory. The
20 thumbnail picture in the thumbnail directory will act as new logo & index picture for video. The connection between original logo & index picture and video is cut. The original picture is free.

If the original logo picture is locked by another index
25 mark 724 and it has "logo only" status 725 in current index mark, the "protected" status of the picture will not be cleared 726, its directory name in current index mark will be modified to the thumbnail directory. This thumbnail directory in the current index mark will automatically lead
30 the camcorder to read the thumbnail picture in thumbnail directory as the logo picture. The connection between original logo picture and current video clip is cut.

If the original logo picture is locked by another index
mark and it has "logo & index" status 727 in current index
35 mark, the "protected" status of the picture will not be cleared 728. Its directory name in current index mark will

be modified to the thumbnail directory. The thumbnail picture in the thumbnail directory will act as new logo & index picture for video. The connection between original logo & index picture and current video clip is cut.

5

3) The logo picture will not be recorded to video frame 705 at this moment. Nothing changes 729.

10 e) The user can simply replace the original logo picture by another picture, by exchanging their file names (and modifying the directory name in index-mark code, if they are not located in the same directory).

15 f) When the video on tape is cleared, the camcorder will promote the user to insert the related media-card, and clear all related index marks from the index file in the media-card, and clear the "protected" status of all related pictures.

20

5. Index Fixing 800 (see Fig. 11)

25 a) Index-mark codes can link index pictures to video essences. The user can use an index picture to search video essences. Furthermore, the user can use an index picture to summary video contents, which are linked to the same index picture. The camcorder can automatically read index-mark codes in an index file of a media-card.

30 b) The user can play video essences through "clicking" an index picture. Furthermore, the user can use index pictures to edit video contents.

35 c) The user may use the original picture as index picture 801 so that no further actions is necessary 802, and the user may also generate a thumbnail picture based on the

original one and use the thumbnail picture as new index picture 803. The thumbnail picture is saved in the thumbnail directory and it has the same name as that of the original picture.

5 If the picture is not locked by another index mark 804 and it has "index only" status 805 in current index mark, the "protected" status of the picture will be cleared 806. The directory name in current index mark will be modified to the thumbnail directory name. The connection between the
10 original picture and video essence is cut. The original picture is free.

If the picture is not locked by another index mark 804 and it has "logo & index" status 807 in the current index mark, the user can choose between "thumbnail as logo too"
15 808 and "thumbnail not as logo" 809:

When user chooses "thumbnail as logo too" 808, the "protected" status of the picture will be cleared 810. The directory name in current index mark will be modified to that of the thumbnail directory name. The connection between the
20 original picture and video essence is cut. The original picture is free. The thumbnail acts as both logo and index picture.

When the user chooses "thumbnail not as logo" 809, the "protected" status of the original picture will not be
25 cleared, but its status label in the current index mark will be modified as "logo only" 811. From now on, this picture will act as pure logo picture. In this scenario, a new index mark with "index only" status label, which points to the same video essence as that of the original index picture,
30 must be created for the thumbnail picture, so that the user can use the thumbnail as index picture.

If the picture is locked by another index mark 812 and it has "index only" status 813 in current index mark, the "protected" mark of the picture will not be cleared 814. The directory name in the current index mark will be modified to the thumbnail directory name. The connection between the original picture and current video essence is cut.

If the picture is locked by another index mark 812 and it has "logo & index" status 815 in current index mark, the "protected" status of this picture will not be cleared. In this case, the user may choose between "thumbnail as logo 5 too" 816 and "thumbnail not as logo" 817: When user chooses "thumbnail as logo too" 816, the directory name in the current index mark will be modified to the thumbnail directory name. The connection between the original picture and current video essence is cut 818. When the user chooses "thumb-10 nail not as logo" 817, the status label in the current index mark will be modified as "logo only" 819. From now on, this picture will act as pure logo picture. In this scenario, a new index mark with "index only" status, which points to the same video essence as that of the original index picture, 15 must be created for the thumbnail picture, so that the user can use it as index picture.

6. Application Examples

20

Scenario 1:

While camera-man is shooting a video scene or object, he is used to explain something about the scene or object. His voice will be recorded with the video content together. In 25 this case, the camera-man can only be heard, not be seen. Usually, it is desired to hear his voice and see his face at the same time, just like that in TV-news program, while talking to a journalist through phone call, a photo of the journalist will be shown as logo picture in the display. 30 With the help of this invention, the camera-man makes himself to be visible in video scene too. At first, the camera-man takes a photo or an e-video clip of himself. Then, while video recording, he set this photo or e-video clip as logo picture to the video content.

Scenario 2:

Usually, photos and e-video clips are highlight contents of videos. They can be used as logo labels to summary video contents, or provide additional visual messages to video
5 contents. For example, one may take a photo of Eiffel-Tower and use this photo as logo image for all video contents, which are recorded in Paris, or using Brandenburger-Tor as logo for all video taken in Berlin. If an e-video clip is created as logo to video, it provides a kind of simulated
10 "picture in picture" effect.

Scenario 3:

By using recorded index pictures, the camera-man can search video contents quickly and effectively. They can help
15 the user to edit videos efficiently.

Scenario 4:

By using this invention, one can generate rich media metadata for video essence. Such rich metadata will be used
20 widely in the future.

Claims

1. Method for linking multimedia data including the steps of

5

providing first and second multimedia data, wherein said first and second multimedia data comprise video, photo and/or audio data;

10 forming linking information (209) on the basis of said first and/or second multimedia data; and

15 storing said linking information (210) on a first recording medium (202) together with said first multimedia data (201).

2. Method according to claim 1, wherein said linking information includes logo (302) or index messages (405) for video or photo data, respectively.

20

3. Method according to claim 1 or 2, wherein said photo data and said video data are linked by a photo picture included in said photo data and/or a video section included in said video data.

25

4. Method according to one of the claims 1 to 3, wherein said forming (209) of linking information is performed in real time while data recording.

30 5. Method according to one of the claims 1 to 4, wherein said forming of linking information includes editing of said linking information.

35 6. Method according to one of the claims 1 to 5, further including the step of storing said linking information

(211) on a second recording medium (207) together with said second multimedia data (206).

7. Method according to one of the claims 1 to 6, wherein
5 said first recording medium (202) and/or said second re-
cording medium (207) is a tape, optical disc, hard disc
or media-card.

8. Device for recording multimedia data including

10 providing means for providing first and second multime-
dia data, wherein said first and second multimedia data
comprise video, photo and/or audio data;

15 linking means connected too said providing means for
forming linking information (209) on the basis of said
first and/or second multimedia data; and

20 storing means connected to said linking means for stor-
ing said linking information (210) on a first recording
medium (202) together with said first multimedia data
(201).

9. Device according to claim 8, wherein said linking infor-
25 mation includes logo (302) or index messages (405) for
video or photo data, respectively.

10. Device according to claim 8 or 9, wherein said photo

30 data and said video data are linked by a photo picture
included in said photo data and/or a video section in-
cluded in said video data.

35 11. Device according to one of the claims 8 to 10, wherein
said forming (209) of linking information by said link-
ing means is performable in real time while data re-
cording.

12. Device according to one of the claims 8 to 11, wherein said linking means includes editing means for editing said linking information.

5

13. Device according to one of the claims 8 to 12, further including additional storing means for storing said linking information (211) on a second recording medium (207) together with said second multimedia data (206).

10

14. Device according to one of the claims 8 to 13, wherein said first recording medium (202) and/or said second recording medium (207) is a tape, optical disc, hard disc or media-card.

15

15. Camcorder (200) including a device according to one of the claims 9 to 14.

Abstract

EPO-Munich
33
04.Juli.2002

Method and Device for linking Multimedia Data

5 It is desired to link photo data and video data taken by a digital camcorder (200). Therefore, there is provided a device and method for linking multimedia data, wherein linking information is formed (209) on the basis of first and/or second multimedia data. The linking information is stored
10 (210) on a recording medium (202) together with the first multimedia data (201). The second multimedia data may be stored (206) together with respective linking information (211) to the first multimedia data on a second recording medium (207). Thus, a camera-man while recording is able to
15 set up logo or index pictures for a video film.
